The United States Needs a National Alzheimer’s Prevention Goal

The United States should set an ambitious national goal to prevent Alzheimer’s disease and related dementias.

It is time to replace despair and disappointment with determination and hope. It is time to show there are steps that our nation can take to reduce the risk of Alzheimer’s and dementia, delay onset, and promote brain health. And most importantly, it is time to rally Americans to take action.

Alzheimer’s disease is a public health crisis that is expanding as our nation ages, with a projected increase to nearly 14 million people in the U.S. with the disease by 2050. Communities of color and women bear a disproportionate burden. Without early intervention and treatment, the cumulative care costs are projected to exceed $20 trillion over the next 30 years.

Our nation must do more to change the course of this disease. Emerging science points to the ability to reduce dementia risk and slow the rate of cognitive decline as people age through early detection and non-pharmacological and pharmacological interventions across the lifespan, particularly in midlife and at the earliest pre-dementia stages. Studies indicate more than a third of dementia cases are potentially preventable by addressing risk factors including education, treatment of hypertension, exercise, social engagement, smoking, hearing loss, depression, diabetes, and obesity.

It will take a new national commitment, new partners, new approaches, and new attitudes to get in front of this disease. Cognitive decline is not inevitable. And, while deaths from other major causes such as heart disease have decreased, the number of deaths from Alzheimer’s disease have increased exponentially. As a nation, we must take a new approach to focus not only on curing Alzheimer’s disease and related dementias but preventing it in the first place.

For too long, people living with dementia their families and caregivers have heard of the disappointments of drug trials and the difficulty of finding an Alzheimer’s cure. That must change – now.

Make no mistake, research must continue into promising disease-modifying drug therapies to treat Alzheimer’s and its symptoms for patients in the early stages of dementia. But to truly reduce the number of people impacted by this devastating disease, our nation must build on the concrete research findings showing that public health interventions and lifestyle modifications may prevent or delay the onset of Alzheimer’s and related dementias and disrupt progression of mild cognitive impairment.

A growing number of government organizations and advisory groups are increasingly aligned in the position that it is possible to reduce the risk of dementia, including the World Health Organization, the Lancet Commission, the American Heart Association, and the Centers for Disease Control and Prevention.
There are far-reaching benefits of this effort, as research shows dementia seems to be tightly connected to other chronic conditions. A national prevention strategy to reduce dementia risk offers a unique opportunity to mobilize clinical, policy, and public health efforts to reduce diabetes, hypertension, tobacco use, and depression, particularly among communities of color.

The U.S. should set a national prevention goal that is ambitious and achievable. This goal must include dates to strive for, a roadmap to guide the efforts, metrics to measure progress along the way, and a focus on healthcare equity that recognizes the disproportionate impact of Alzheimer’s and related dementias on communities of color and women. Establishing dementia prevention as a clinical and research priority with measurable, time-bound targets will build on current efforts and drive changes in clinical practice, public health, research and innovation - just as our nation has done for heart disease and other health challenges.

A clear prevention “north star” will benefit families, society, economy and our nation. Preventing or delaying dementia will

- Reduce financial pressure on the healthcare system and lower costs to public programs such as Medicare and Medicaid,
- Decrease the cognitive, physical, psychological and economic burdens on those living with symptoms that often last more than a decade and their families,
- Improve quality of life for individuals of all ages, and
- Increase the likelihood that adults can thrive and remain independent into their later years.

We call on leaders, organizations, colleagues, and partners in government and the private sector, in public and clinical health, chronic disease prevention, wellness, and health equity to join in this call for the United States to adopt a national, measurable, time-bound impact prevention goal to reduce the number of people with Alzheimer’s and related dementias.
